Planning Guidance: Contamination Statement
Does the site described herein involve any of the following:
a. Land which is known to be contaminated? No
b. Land where contamination is suspected for all or part of the site? Yes
c. A proposed use that would be particularly vulnerable to the presence of contamination? No

Appendix A2 – Supporting Information

Appendix A3 – Qualitative Risk Assessment Rationale

1.0 Introduction

1.1 Brief

In March 2016 Curtins were instructed by Panacea Property Development to undertake a Phase 1 Desk Top Study of Strand House and associated car park, The Strand, Liverpool (L1 8LT). It is understood that the site is to be redeveloped via the implementation of a nineteen (No.) storey residential block relating to the private rented sector with a part basement level car parking facility located within the north and east of the site. The ground level is to be developed for retail use, resident's reception and other shared facilities. The proposed development plans are included within Appendix A1.

The site is centred on National Grid Reference, 334220, 390110, and occupies an approximate area of 0.36ha. A location plan is presented below in Section 2.1.

As noted, the Phase 1 Preliminary Site Assessment has been undertaken in support of the re-development of the site as mixed use facility incorporating an area for car parking.

1.2 Scope

The Phase 1 is intended to provide an overview of the geo-environmental and geo-technical setting of the site of interest.

Through this overview the Phase 1 aims to develop both a working conceptual and ground model for the site, as well as present an initial assessment of any risks that could be presented to the development including its intended end users and the wider environment.

Specifically, the Phase 1 provides an initial assessment of the site with regard to:

- a) Potential contamination of the site strata by historical and or current use.
- b) The potential impact on the wider environment by historical and or current use of the site of interest.
- c) The potential impact from surrounding land uses and other environmental factors.
- d) Potential problems associated with geological features such as faulting, mineral extraction, mining and land instability.
- e) The location of apparent sub-surface structures that may affect the proposed redevelopment.
- f) The location of above-surface features that may affect the proposed redevelopment.

2.0 Desk Study

In accordance with the scope identified in Section 1.1, this desk study has been undertaken using the following data sources.

- Envirocheck Report, 2016
- British Geological Society records, accessed 2016
- Environment Agency website, accessed 2016
- Coal Authority website, accessed 2016
- Zetica Regionally Unexploded Bomb Risk, Manchester
- Radon Atlas for England and Wales

2.1 Current Setting

The site is situated off A5036 Strand Street, located adjacent to the Liverpool Dockyard region, approximately 70m north-east of Canning Dock and 50m south-west of Liverpool Crown Court. The Liverpool ONE development is located further to the south-east, while the River Mersey is situated beyond the docklands to the west. A site location plan is presented on the following page in Figure 2.1.

The site is bound by Strand Street, located to the south-west; Red Cross Street, located to the north-west; the Liverpool Crown Court building, located to the north-east; and further existing building developments to the south-east.

The current surrounding land use comprises mixed commercial, industrial, residential, leisure and transport. A notable proportion of the ambient region is associated with historic docklands and associated infrastructure.

The site currently incorporates a four office building incorporating car parking at ground level in the form of surface parking within the central and northeast of the site. As such, the site is currently divided in use, with the south-western proportion of the site currently maintaining a building development with the north-eastern proportion of the site maintaining an undeveloped car park.

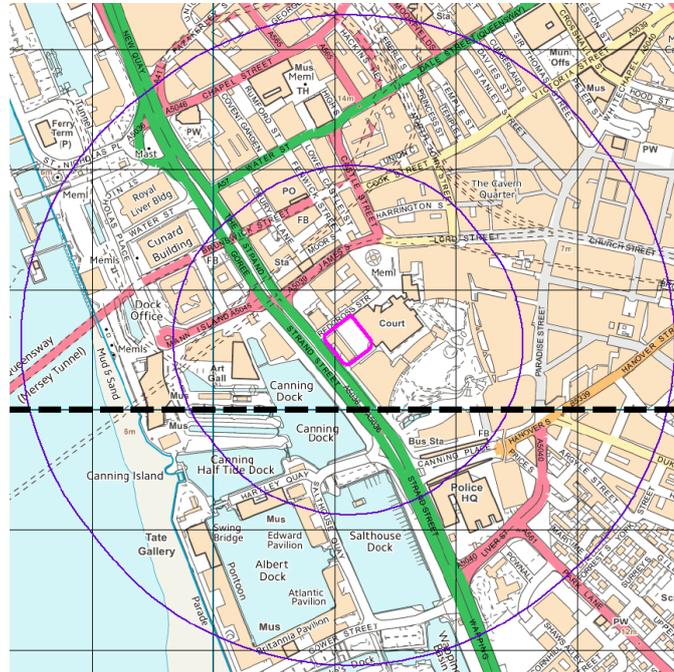

Figure 2.1 Site location plan. Development site boundary identified in pink.
Centre of site located at National Grid Reference: 334220, 390110

2.2 Previous Site Uses

A review of the available historical mapping information for the site (as presented within the Envirocheck report (Ref.1)) has been undertaken and is presented in Table 2.2 below. Potential sources are not repeated where the same in succeeding years.

Table 2.2 Previous Site Uses and Potential Sources of Contamination

Date	Description	Potential Sources of Contamination
1850; 1864; 1888; 1891; 1893;	<p>The site incorporates a number of variable use building developments; the site is fully developed at the point of earliest historical assessment. Strand Street and Red Cross Street are present in its current alignment.</p> <ul style="list-style-type: none"> The site incorporates a large warehouse facility (Wholesale Grocers and Drysalers), maintained across the south-western proportion of the site; Evidence of demolition and site development. A number of small scale Works are distributed across the site including metal works (south-east), joiner works (west), cotton and rubber works (east), factory (east), cotton works (central), engineering works (central) and smithy works (central). Printing works appear to intersect the eastern proportion of the site; The site maintains the presence of a number of small terrace dwellings, shops, public houses and warehouses. 	<ul style="list-style-type: none"> Uncontrolled deposition of Made Ground from unknown sources associated with the removal of old buildings and site redevelopment. Potential ash and clinker deposition associated with metal works, smithy and uncontrolled combustions processes during this period. Localised fuel/ /chemical spillages from engines and associated industrial equipment. Storage of unknown substances within warehouse compounds. Contamination arising from material use and development of works onsite. Specific contamination associated with variable works. Storage and use of printing inks.

Date	Description	Potential Sources of Contamination
1944; 1953; 1954	<p>The majority of the site remains consistent with evidence of possible demolition across the western proportion of the site.</p> <ul style="list-style-type: none"> An additional printing works is located within the centre of the site; A unit, noted as Asbestos and Engine Showroom, is located at the southern proportion of the site. A unit noted as per the use of electro plating Bonded warehouse located on eastern boundary 	<ul style="list-style-type: none"> Uncontrolled deposition of Made Ground from unknown sources associated with the removal of old buildings and site redevelopment. Contamination arising from specific industry. Storage and use of printing inks Storage and use of asbestos
1959-1972; 1963; 1969	<ul style="list-style-type: none"> Modification to the large warehouse facility across the south-western proportion of the site, which has been extended to the north. A garage is located at the northern proportion of the site. Factory noted at northern proportion of site. 	<ul style="list-style-type: none"> Development of Made Ground. Presence of asbestos and ACM's incorporation/utilisation. Hydrocarbon and petroleum based contamination arising from vehicles. Leaks/spillages of contaminants associated with site.
1970-1971	<ul style="list-style-type: none"> Evidence of demolition across the site with the majority of the buildings within the centre of the site now removed. A notable proportion of the site is now associated with a Car Park (extending off site to the southeast) 	<ul style="list-style-type: none"> Generation and deposition of demolition wastes onsite. Spillages/leakages associated with construction/demolition processes. Hydrocarbon contamination associated with vehicle presence on car park.
1983-1986; 1984-1989; 1993	<ul style="list-style-type: none"> Evidence of further demolition noted across the site; there are no structures no shown on the site (1982-87). 	<ul style="list-style-type: none"> Deposition of demolition wastes onsite.
1996-present	<p>The site has been developed and maintains the presence of Strand House across the southern proportion of the site. The northern proportion is described for the purpose of car parking.</p>	<ul style="list-style-type: none"> Development of Made Ground. Contamination arising from construction/demolition processes.

Potential sources of on-site contamination are further discussed in Section 3.0.

2.3 Immediate and Surrounding Land Uses

A review of the available historical mapping information for the immediate surrounding (<100m distance) and surrounding (>100m distance) areas (as presented within the Envirocheck report (Ref. 1) has been undertaken with specific reference to potential sources of contamination the findings of which are detailed in Table 2.3 on the following page. Potential sources are not repeated where the same in succeeding years.

Table 2.3 Land Uses in Immediate and Surrounding Areas and Potential Sources of Contamination

Date	Description	Potential Sources of Contamination
1850's-1900	<ul style="list-style-type: none"> The wider region, during the period of earliest historical analysis, presents a fully developed location. The region comprises high density urbanised buildings including warehouse storage, commercial, industrial and domestic. A number of buildings within close proximity to the site maintain such designations. The Liverpool docklands (located 70m south-east) are fully developed and operational during this period. Development of docklands railway network (50m south-west) adjacent to the site running in a north-west south-east direction (incorporates associated industrial processes and infrastructure). Furthermore, a tramway is located approximately 100m north/75m east of the site. Processes of wider urban developed noted during this period; evidence of additional construction, demolition and re-development. Evidence of building demolition and re-development adjacent to the site across, the north-eastern and south-eastern boundary. A number of notable industries are located within the surrounding region including; Mersey Paint Works (250m south-east), paint works (280m south-east), timber yard 230m south-east, the Mersey Foundry (320m south-east) and canning Dock Works (50m south-east). Albert Hydraulic Station is situated 180m south-west. 	<ul style="list-style-type: none"> Contamination arising from docklands transport and associated infrastructure. Uncontrolled deposition of Made Ground from unknown sources associated with the removal of old buildings and site redevelopment. Substance storage of an unknown nature. Industry specific contamination. Ash and clinker development via combustion –processes, synonymous of era Spillages and leakages of substances associated with works and industrial operation. Combustion of fuels, spillages of oils/fuels/chemicals, works processes associated with railway infrastructure and operation. Contamination arising from ground excavation
1888 Historic building Plan	<ul style="list-style-type: none"> The adjacent region incorporates high density structures maintaining a multi-use purpose. The region comprises high density urbanised buildings including warehouse storage, commercial, industrial and domestic. A number of buildings within close proximity to the site maintain such designations. A number of noteworthy industries are located within the surrounding region including; biscuit factory (south-adjacent), metal works (south-east-adjacent), iron and tin works (35m south-east), printing works (north-west-adjacent) and smithy (25m south-east). 	<ul style="list-style-type: none"> Contamination arising from specific industrial presence within the adjacent region. Leakages and spills associated with the use and storage of paint/ink products
Early 1900's – 1954-1957	<ul style="list-style-type: none"> The region comprises high density urbanised buildings including warehouse storage, commercial, industrial and domestic. A number of buildings within close proximity to the site maintain such designations. Georges Dock, previously located 180m north-west, has been infilled; the site now incorporates a number of commercial buildings. The Mersey railway tunnel and Queensway Tunnel are located approximately 300m south-west of the site. Notable demolition and re-development 100m north of the site. Notable demolition and re-development 120m west of the site. Evidence of notable demolition within the surrounding region; the majority of the previous site developments are now described as car parks. A pumping and ventilating station is located, adjacent to James Street Station, 110m west of the site. A steam pump shed is located approximately 350m west of the site. A salvage plant depot is located 300m south-west. Electrical sub-stations are located 60m north, 120m west, 290m north-east and 280m north-east. A number of notable industries are located within the surrounding region including; printing works (<10m east), warehouse facilities (<10m north-east), printing works 20m north, garages (approximately 100m west), 	<ul style="list-style-type: none"> Uncontrolled deposition of Made Ground from unknown sources associated with the removal of old buildings and site redevelopment. Development of Made Ground and potential ground gases via docklands infilling. Contamination arising from fuels and chemical spillages associated with rail network and relevant infrastructure. Hydrocarbon and heavy metal contamination associated with enhanced car usage and parking facilities. PCB's, hydrocarbons and asbestos development associated with Electrical Sub-Stations. Contamination arising from construction processes. Notable ground excavations associated with tunnel development.

Phase 1 Preliminary Site Assessment

Date	Description	Potential Sources of Contamination
1944 Historic Building Plan	<ul style="list-style-type: none"> The adjacent region incorporates high density structures maintaining a multi-use purpose. The region comprises high density urbanised buildings including warehouse storage, commercial, industrial and domestic (a number of works are located within the surrounding region). A number of buildings within close proximity to the site maintain such designations. A number of noteworthy industries are located within the surrounding region including; asbestos and engine showrooms (south-adjacent), rubber and asbestos (25m north-east), garage (30m north-east), asbestos warehouse (90m east), rubber/asbestos/cotton waste warehouse (80m south-east), paint warehouse (90m south-east), 	<ul style="list-style-type: none"> Asbestos contamination arising from specific asbestos works and also as used in buildings/industry Substance storage of an unknown nature. Ash and clinker development and deposition, via combustion processes -synonymous of era
Mid 1950's - 1984	<ul style="list-style-type: none"> The region comprises high density urbanised buildings including warehouse storage, commercial, industrial and domestic. A number of buildings within close proximity to the site maintain such designations. Evidence of wider urban development noted across the region. The region adjacent to the site to the south-east has been developed into a Car Park. Notable large-scale carpark development 180m east A number of underground railway lines are noted across the wider region. A number of electrical sub-stations are noted across the region including; 300m north-east, 200m north-east, 280m north-east, 260m east, 270m south-east. 150m south-east and 140m north-west. A number of notable industries are located within the surrounding region including; garage (30m north-east), works (approximately 300m south-east), motor engineering works (220m south-east), fire station (160m south-east), factory (260m south-east) and works (90m west). A bus station is located 90m east. Notable evidence of demolition to the south-east and north-west of the site during the early 1980's. Development of buildings 20m north-west. 	<ul style="list-style-type: none"> Uncontrolled deposition of Made Ground from unknown sources associated with the removal of old buildings and site redevelopment. Development of hydrocarbon and petrochemical contamination associated with vehicle presence. Industry related contamination Asbestos related contamination.
1953 Historic Building Plan	<ul style="list-style-type: none"> The adjacent region incorporates high density structures maintaining a multi-use purpose. The region comprises high density urbanised buildings including warehouse storage, commercial, industrial and domestic (a number of works are located within the surrounding region). A number of buildings within close proximity to the site maintain such designations. A number of noteworthy industries are located within the surrounding region including; garage (40m south-east) and refrigeration engineers (30m north-east). 	<ul style="list-style-type: none"> Industry related contamination Spills and leaks associated with garage operations Hydrocarbon contamination arising from garage presence Contamination arising from adjacent Refrigeration Engineers (30m north-east)
1963 Historic Building Plan	<ul style="list-style-type: none"> The adjacent region maintains a warehouse storage, commercial, industrial and domestic land-use presence. A number of noteworthy industries are located within the surrounding region including; engineering warehouse (20m north-west) and rubber/asbestos goods warehouse (60m south-east). 	<ul style="list-style-type: none"> Storage of unknown materials/substances within engineering warehouse Asbestos, and other contaminant, accumulation via adjacent storage facility (60m south-east)
1969 Historic Building Plan	<ul style="list-style-type: none"> The adjacent region maintains a warehouse storage, commercial, industrial and domestic land-use presence. A number of noteworthy industries are located within the surrounding region including; a garage (60m north), electrical stores (90m south-east) and parking facilities. Sunk petrol tanks are located 30m north-east. 	<ul style="list-style-type: none"> Spills and leaks associated with car parking facilities Potential for PCB's and other contaminant development via electrical stores Leaks associated with sunk petrol tank (30m north-east)

Date	Description	Potential Sources of Contamination
Mid 1980's – Late 1990's	<ul style="list-style-type: none"> Large Courts of Law building developed adjacent to the site to the north-east. Evidence of wider urban development Development of urban parklands to the south-east. 	<ul style="list-style-type: none"> Uncontrolled deposition of Made Ground from unknown sources associated with the removal of old buildings and site redevelopment.
2000 - Present	<ul style="list-style-type: none"> Notable demolition 200m east of the site followed by subsequent large scale redevelopment. Evidence of further urban development across the region 	<ul style="list-style-type: none"> Uncontrolled deposition of Made Ground from unknown sources associated with the removal of old buildings and site redevelopment.

Potential sources of off-site contamination are further discussed in Section 3.0.

2.4 Geology

A study of the Envirocheck report (Ref.1) and British Geological Survey (BGS) 1:50,000 mapping records (Bedrock and Superficial Editions), Sheet No.096 for Liverpool (Ref.2) and BGS interactive Geology Map (Ref.3) indicates the following geological succession underlying the site.

BGS Geological Succession	
Superficial Geology	<ul style="list-style-type: none"> Tidal Flat Deposits; Normally a consolidated soft silty clay, with layers of sand, gravel and peat
Solid Geology	<ul style="list-style-type: none"> Chester Pebble Beds Formation comprising Sandstone, fine- to coarse-grained, commonly pebbly, with conglomerates and sporadic siltstones; cross-stratified

A number of BGS historical borehole records (Ref.3) are available associated with the wider region, the closest, located adjacent to the site boundary (west) along Red Cross Street (ID: SJ39SW1098 at National Grid Reference 334180,390130), was terminated at a depth of 50m bgl. The reported log presents a thin layer of backfill (0.0-2.0m bgl), followed by; backfill and clay (2.0-2.6m bgl), red sandstone (2.6-5.0m bgl), sandstone with layers of marl (5.0-27.0m bgl), hard sandstone (27-33m bgl) and red sandstone (33-50m bgl). Additionally, a further borehole is located approximately 60m north-east of the site within the confines of the current Law Building (ID: SJ39SW1780 at NGR 34270, 390148) maintained to a termination depth of 3.20m bgl. The reported log presents a thin layer of cobblestone, concrete and brick (0-0.2m bgl), brown and grey sand, brick, stones, etc, fill material (0.2-1.7m bgl) and soft reddish brown laminated fine-grained sandstone (1.70-3.20m bgl).

No recorded BGS fault lines are noted intersecting the site. Analysis of the wider region suggests the presence of three fault lines within 1000m of the site. The nearest identified fault line is located approximately 100m to the east of the site, trending in a general north-south direction (the down-throw is not indicated).

BGS analysis suggests that the site is not within an area known to be affected by Made Ground however, analysis of local BGS borehole logs suggests Made Ground is present on site. The site currently maintains the presence of a large building and associated car parking facilities, in addition to historical processes of site re-development, the presence of Made Ground features are determined to be likely onsite.

2.4.1 Mining

The Envirocheck Report (Ref.1) confirms that the site is situated within an area which might not be affected by coal mining. Based on the foregoing commentary the likelihood of encountering relic mining features on site is considered to be unlikely and therefore has not been considered further.

2.4.2 Other Ground Stability Hazards

The Envirocheck report (Ref.1) confirms that there is a very low risk to no hazard from the following ground stability hazards on and around the site; running sands, collapsible, landslides shrinking or swelling clay and ground dissolution. The report outlines a moderate hazard risk to compressible ground on site and within the surround area.

2.4.3 Radon

The BGS Radon Mapping, included with the Envirocheck report (Ref.1) confirms part of the site is situated in a lower probability radon area as less than 1% of homes are above the action level. On this basis, radon protection measures are not considered necessary within the proposed development and have not been considered further.

2.4.4 BGS Estimated Soil Chemistry

The BGS website provides soil chemistry for the site, which estimates the following metal concentrations within rural soil and sediment; arsenic <15mg/kg, cadmium <1.8mg/kg, lead 200-300mg/kg, Chromium 90-120mg/kg and nickel 30-45mg/kg.

2.5 Hydrogeology

The Groundwater Vulnerability Map presented within the Envirocheck report (Ref.1) indicates that the site is underlain by a Principal Aquifer (Chester Pebble Beds). Principal Aquifers are defined as layers of rock or drift deposits that have a high intergranular and/or fracture permeability meaning they usually provide a high level of water storage. They may support water supply and/or river base flow on a strategic scale. In most cases, Principal Aquifers are aquifers previously designated as Major Aquifers.

The superficial geology (Tidal Flat Deposits) associated with the site are maintained as Unproductive Strata. Unproductive Strata is defined as rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.

The site is not located within a designated Source Protection Zone (SPZ).

The Envirocheck Report (Ref.1) notes low permeability drift deposits occurring at the surface and overlying Principal and Secondary A Aquifers are head, clay-with-flints, brickeneath, peat, river terrace deposits and marine and estuarine alluvium.

There are no recorded groundwater abstractions within 500m of the site. BGS flood data included within the Envirocheck report identifies that there is limited potential for groundwater flooding to occur at the site.

Given the proximity to the River Mersey it is expected that groundwater flow is in a westerly/south-westerly direction.

2.6 Hydrology

The nearest identified surface water feature is located 54m south-west of the site, beyond A5036 Strand Street and promenade. The feature is suggested as Canning Dock, an aspect of the Port of Liverpool associated with River Mersey access.

There are no recorded surface water abstractions within 500m of the site.

A number of discharge consents are noted within 1000m of the proposed site location. The closest position, noted 217m south-west, is associated with Pilkington Technology Ltd (Prescott Road, St. Helens) for the purpose of trade discharges (cooling water). The discharge environment is noted as Thatto Heath Brook. In addition, a further consent is noted 217m south-west of the site; associated with Liverpool County Council, the process is noted as sewage discharges (final/treated effluent – not Water Company). The receiving water is noted as Childwell Brook.

A number of locations associated with pollution incidents to controlled waters are noted within the 1000m reported survey buffer. The closest location is situated 352m north of the site for an unknown property type (1993) and unknown receiving water. The incident severity is described as category three (minor incident).

A single substantiated pollution incident is noted 754m south-east of the site; the event (dated March 2014) maintains no impact upon water or air but a significant impact upon the land.

Soils of high leaching potential is assumed onsite, maintaining a vulnerability classification to groundwater of H, until proved otherwise.

The site is not known to be situated within a location deemed at risk of flooding from river or sea water inundation. The report makes note of a proportion of the coastline, located approximately 300m to the west, which may be affected by extreme flooding of the River Mersey.

The site is noted to be within an area believed to be affected by surface water flooding. The central proportion of the site is depicted at risk low risk (1000 year return period event). A number of location, distributed within 50m of the site suggesting low (1000 year return period event), medium (100 year return period event) and high (30 year return period event) risk of surface water flooding.

2.7 Landfill

The Envirocheck Report (Ref.1) indicates the presence of three historical landfill sites within 1000m of the site. The closest recorded historical landfill site, located 615m south of the proposed location (Queens Dock Number Two), is described for the purpose of deposited waste including inert and industrial waste. The site operated between September 1984 and December 1987.

A total of three local authority recorded landfill sites are distributed within 1000m of the site. The closest site, located 663m south of the proposed location (Kings Dock Number One & Two). The landfill is recorded as having received inert and industrial waste between 1982 and 1987, and was operated by Merseyside Development Corporation.

A single registered landfill site is situated 779m south of the site. The site maintains a very large maximum input rate (equal to or greater than 250,000 tonnes per year) for an unknown waste source.

There are no registered waste transfer sites within 500m of the proposed location.

A number of locations suggested as maintaining infilled land are noted within 1000m of the site location. The proximity to the River Mersey and historical docklands suggests the development of land reclamation as a contributing factor. The Envirocheck Report (Re.1) indicates the closest position 154m west of the site; dated 1884, infilling may be the result of reclamation following the removal of George Dock.

2.8 Unexploded Ordnance (UXO)

Military activities including those conducted as part of both the First and Second World Wars have resulted in a legacy of unexploded ordnance (UXO) being present within the shallow soils of the UK.

UXO result from various sources including both allied (military training) and German (bombing raids) with a guide figure of approximately 10% of all munitions failing to function as designed.

The likelihood of UXO being encountered on a development site is influenced by a number of factors including; the proximity to strategic targets, the nature of the development works being undertaken and evidence of local damage in the post-war periods amongst others. In order to determine the likelihood of UXO being present on a site, a step-wise risk assessment process is followed. This

process is outlined within CIRIA C681 *Unexploded Ordnance: A Guide for the Construction Industry* with the following commentary considered to represent a Preliminary Risk Assessment intended to guide if and where there is a requirement for a Detailed Risk Assessment.

Risk mapping for unexploded ordinance (Ref.4) has placed the majority of Liverpool within a high risk area (high risk inferring areas that present a high density of bombing hits or 50+ bombs per 1000 acres and abundant potential WWII targets. In high risk areas, further action to mitigate UXO risk is considered essential.

The Detailed Unexploded Ordnance (UXO) Risk Assessment (Ref.5) highlights a medium risk from UXO across the site.

- During WWII the County Borough of Liverpool was subjected to a High Density bombing campaign, with 91.5 items falling per 1,000 acres. The bombing of Liverpool was focused on the City Centre and the Liverpool Docks.
- The site is within the city centre of Liverpool, which was bombed severely. Multiple incidents of HE damage can be seen close to the site area on a small scale map obtained from the Liverpool Record Office.
- Very limited information regarding the bombing of the City of Liverpool has survived to date. No detailed bomb plot or damage maps, or complete set of incident records appear to have survived the war. It is possible that the serious damage Liverpool sustained over a short period of time in May 1941, meant that accurate record keeping was not achieved. It has therefore not been possible to determine exactly where bombs fell within the city, and other data such as post-war mapping and photography therefore become an essential tool in looking at changes resulting from damage and assessing whether ground conditions present would have been conducive to the observation of UXB entry holes.
- Several areas within the centre of the site appear to have been cleared post-war. Within the north-east of the site two structures appear to have been reduced to ruins. It is considered likely that these changes were the direct result of bomb damage, and that an amount of rubble and debris would have been present across these areas.
- Evidence of UXO could easily be overlooked within areas of debris resulting from bombing – note that the entry hole of a 50kg bomb could be as little as 20cm in diameter.
- While areas of the site did survive the war, the risk from ‘J-Curve’, where a bomb can end up laterally offset from its point of entry (see section 10.4) means that no one area can be considered at ‘low’ risk. A ‘buffer zone’ has been placed around these cleared/damaged areas to account for this possibility of ‘J-Curve’.
- There has been some re-development on the site post WWII. The extent of the developments and depth of foundations can partly mitigate the UXO risk as any present items of UXO may have been uncovered during the works.
- Any developments involving deep intrusive works will have mitigated the risk of deep-buried unexploded bombs at the locations of piling and foundations. Any smaller developments may have partially mitigated the risk of encountering shallow buried UXO especially 1kg incendiaries and anti-aircraft projectiles.

2.8.1 Unexploded Ordnance (UXO) Recommend Risk Mitigation Measures

The following risk mitigation measures are recommended to support the proposed works at The Strand, Liverpool site:

All works

- Site Specific Unexploded Ordnance Awareness Briefings to all personnel conducting intrusive works

Shallow intrusive works (trial pits, open excavations, shallow foundations etc.)

- Unexploded Ordnance (UXO) Specialist Presence on Site to support shallow intrusive works

Deep intrusive works (boreholes and piles)

- Intrusive Magnetometer Survey of all Borehole and pile locations down to a maximum bomb penetration depth.

2.9 Significant Features Potentially Affecting Re-development

The local historical docklands are designated a World Heritage Site.

James Street Station underground rail system is located approximately 100m north-west of the site.

Queensway (Birkenhead) tunnel is location approximately 200m north-west of the site.

A number of historical tunnel structures are located within the wider region but are not thought to underlie the proposed site location.

2.10 Existing Reports

No existing reports, specific to the subject site, have been made available for review at this stage.

3.0 Conceptual Site Model & Qualitative Risk Assessment

The conceptual site model (CSM) and Qualitative Risk Assessment (QRA) are presented in the table presented in this section. A diagrammatic CSM is contained within Appendix A1.

The CSM details the source-pathway-receptor linkages or potential pollutant linkages (PPL) that have been identified for the site. The QRA details the associated level of risk relating to these potential pollutant linkages.

The CSM and QRA concern risk to human health and water environment with additional, more specific risk assessment protocols contained within the main body of this reporting, as detailed in Section 3.1 below.

The QRA follows the framework outlined within CIRIA C552 which is summarised within Appendix A3.

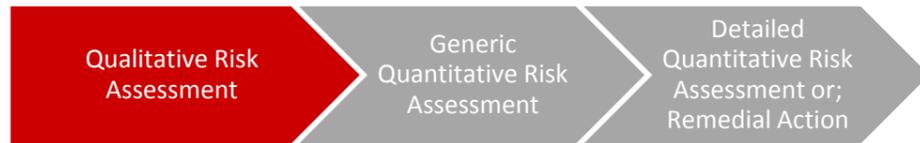

The 'risk rating' within the QRA refers to the risk that the source, pathway, receptor linkage or PPL is complete. Unless specifically stated it does not necessarily refer to an immediate risk and is intended to be used as a tool to assess the necessity for further assessment/investigation.

3.1 Additional Risk Assessments

The following risk assessments, listed below, are not included within the main CSM and QRA but none-the-less can be of critical importance to the onward development of the site.

- The risk presented by Mining is discussed and assessed in [Section 2.4](#).
- The risk presented by Radon is discussed and assessed in [Section 2.4](#).
- The risk presented by Unexploded Ordnance is discussed and assessed in [Section 2.8](#).

Under current health and safety legislation, employers are required to carry out their own appropriate risk assessments and mitigation to protect themselves and their employees, other human receptors and the environment from potential contamination. Such risks must be adequately mitigated by law, specifically the Construction Design Management (CDM) Regulations, 2015 which require that potential risks to human health and the environment from construction activities are appropriately identified and all necessary steps taken to eliminate / manage that risk. It has been assumed that any future construction works on site will be undertaken in compliance with these requirements and therefore construction workers involved in the building works at the site have been discounted as a human receptor in the conceptual site model.

- The table below represents the first stage in the land quality risk assessment process; the Qualitative Risk Assessment.
- In order for a development site to be deemed 'suitable for use' the level of risk needs to be brought down to acceptable levels, i.e. low to negligible risk. The purpose of each stage of risk assessment is ultimately to establish if there is a requirement for additional levels of assessment to be made in order to have sufficient confidence to support a risk characterisation or management decision, e.g. remedial action.
- In the absence of specific site data a Generic Quantitative Risk Assessment is invariably recommended.

Conceptual Site Model			Qualitative Risk Assessment			Action
Source	Pathway(s)	Receptor(s)	Consequence (Potential Severity)	Likelihood of Occurrence	Risk Rating	
<p>On-Site Sources of Potential Contamination</p> <ul style="list-style-type: none"> • Potential of ash and clinker deposition associated with combustion activity • Uncontrolled deposition of Made Ground from unknown sources associated with the removal of old buildings and site redevelopment. • Localised fuel/chemical spillages from engines and associated industrial equipment. • Storage of unknown substances within warehouses. • Contamination arising from material use and development of works onsite. • Specific contamination associated with variable works. • Storage and use of printing inks. • Use of asbestos • Hydrocarbon contamination arising from vehicles. • Development of demolition wastes onsite. <p><i>Potential contaminants of concern associated with the above sources include, amongst others; Hydrocarbons including diesel/petrol range organics from fuel spillages, polycyclic aromatic hydrocarbons arising from incomplete combustion, inorganic compounds including metals, non-metals and asbestos. The presence of printing works and operations onsite infer the potential for volatile organic compound presence.</i></p>	<p>Direct contact, ingestion, inhalation (dust and vapours)</p>	<p>End user of site</p> <p>Employees, general public, construction works, site visitors</p> <p>Construction Workers</p> <p>Site workers involved in all aspects of site development</p>	<p>Medium</p> <p>Chronic health risk</p>	<p>Likely</p> <p>Historical analysis of previous land uses present evidence of numerous periods of site development and modification thereby indicating the probable presence of Made Ground and other construction related contaminants. In addition, the site maintains an industrial and commercial heritage. Analysis indicates the presence of factories and warehouses including (but not limited to) smithies, printing works, cotton works and asbestos works. Subsequent site use suggests the presence of cars and vehicles within the site enhancing the probability of hydrocarbon contamination.</p>	<p>Moderate</p>	<p>Generic Quantitative Risk Assessment</p> <p>Recommended as part of the ground investigation.</p>
	<p>Vertical migration through the superficial deposits (soils)</p> <p>May occur due to existing service corridors and physical processes including; capillary action, burrowing animals inducing soil mixing and downwards into the natural deposits through infiltration.</p>	<p>Water Environment</p> <p>Principal Aquifer</p> <p>There are no recorded groundwater abstraction locations noted within 500m of the site location. The site is not located within an area designated a Source Protection Zone.</p>	<p>Medium</p> <p>Pollution of non-sensitive water resources</p>	<p>Likely</p> <p>If and where contamination is present on site it is likely to be either; present as minor inclusions at relatively low concentrations that, on the balance of probability is unlikely to necessitate remedial action or else, bound in construction materials, e.g. road construction. Notwithstanding, localised areas of higher concentrations cannot be ruled out.</p>	<p>Moderate</p>	<p>Generic Quantitative Risk Assessment</p> <p>Recommended as part of the ground investigation.</p>
	<p>Horizontal migration over and through the superficial deposits (soils)</p> <p>May occur due to the influence of perched or natural groundwater flow patterns and natural or man-made high permeability zones, e.g. sand lenses or drainage runs.</p>	<p>Water Environment</p> <p>The nearest surface water feature is located 54m south-west of the site (noted as Canning Dock).</p>	<p>Medium</p> <p>Pollution of non-sensitive water resources</p>	<p>Unlikely</p> <p>If and where contamination is present on site it is likely to be either; present as minor inclusions at relatively low concentrations that, on the balance of probability is unlikely to necessitate remedial action or else, bound in construction materials, e.g. road construction. The receptor is separated from the site by Strand Street which is likely to maintain surface-water drainage features meaning pollution linkages are likely intercepted prior to Canning Dock. Notwithstanding, localised areas of higher concentrations cannot be ruled out.</p>	<p>Moderate</p>	<p>Generic Quantitative Risk Assessment</p> <p>Recommended as part of the ground investigation.</p>

<p>On and off-site sources with the potential to generate ground gases</p> <p>BGS mapping identifies a significant extent of Made Ground adjacent to the site. The closest is likely associated with the infilling of George's Dock to the west, with material of unknown origin.</p> <p>Evidence of site redevelopment and possible modification to sub-surface material/infilling</p> <p>BGS mapping identifies the presence of Tidal Flat Deposits within the east of the site area and adjacent to the south of the site. Peat deposits within the Tidal Flat Deposits may give rise to the generation and migration of ground gas.</p>	<p>Vertical and horizontal migration through existing service corridors and the underlying superficial deposits</p>	<p>End user of site</p> <p>Residents, general public, construction works, site visitors</p>	<p>Severe</p> <p>Acute health risk, e.g. asphyxiation or risk from explosion</p>	<p>Likely</p> <p>The anticipated presence of Made Ground onsite and associated processes of historical demolition and construction enhance the possibility of adverse conditions to a yet unknown depth.</p> <p>Processes of dockland (George's Dock) infilling is noted within the surrounding region.</p> <p>With reference to BS8576 (2013) <i>Guidance on investigations for ground gas – Permanent gases and Volatile Organic Compounds</i>, these sources are considered to have a Low gassing potential.</p>	<p>High</p>	<p>Generic Quantitative Risk Assessment</p> <p>Recommended as part of the ground investigation.</p>
<p>Unexploded Ordnance</p> <p>During WWII, the site was located in an area of high bombing density, as confirmed by official statistics and mapping. Additional evidence of bombing activity and UXO risk is presented in section 2.8.</p>	<p>Direct Contact through all groundwork activities</p>	<p>End user of site and Construction Workers</p> <p>Residents, general public, construction works, site visitors</p>	<p>Severe</p> <p>Acute health risk, e.g. risk from explosion</p>	<p>High</p> <p>Historical analysis and bomb risk records indicate an enhanced possibility of UXO presence upon the site and within the surrounding area.</p>	<p>Very High</p>	<p>Detailed UXO Report</p> <p>Recommended to be obtained prior to any intrusive works</p>

4.0 Conclusion and Recommendations

The qualitative risk assessment (QRA) determined a varied level of level of risk associated with the proposed development (Low to Very High).

It is recommended that a ground investigation is conducted to confirm this assessment and provide data in support of the structural and civil engineering design. An outline scope for this investigation is detailed below.

It is further recommended that this work is completed in advance of any development works taking place.

4.1 Outline Scope of Works for Ground Investigation

Considering the historic uses of the site and the nature of these sources, potential contamination is expected to be generally dispersed, with localised contamination possibly related to associated works and region of site redevelopment.

On this basis, a non-targeted sampling strategy for the majority of the site is recommended in order to obtain sufficient coverage of the site with reference to the contaminants of concern detailed in the following section.

It is envisaged that the ground investigation will comprise the following actions, all undertaken under the supervision of a suitably qualified engineer in line with current guidance and best practice:

- Boreholes - to provide reliable geotechnical information e.g. soil & rock strength parameters, and the ability to facilitate ground gas/groundwater monitoring.
- Ground Probing Radar Survey - to develop and improved understanding of ground conditions, historical building features and service features.
- Chemical Analysis of Waters - to analyse and assess potential contamination to local waters arising from the site.
- Associated geotechnical and environmental laboratory testing - to develop a working ground model, classify the excavated material for re-use on site and/or disposal and to assess the potential risk to end users of the site and other sensitive receptors.

4.2 Contaminants of Concern

Potential contaminants of concern associated with the sources identified within the Conceptual Site Model in Section 3.0 of this reporting include, but are not limited to: broad range aliphatic and aromatic hydrocarbons present within fuel oils; cyanides; TPH aromatic-aliphatic split; polycyclic aromatic hydrocarbons (PAHs); inorganic compounds including heavy metals; sulphate; sulphur; sulphide; cyanide; phenols; and asbestos present in discarded building materials. Additionally, the historical presence of printing processes noted across the site identifies the potential presence for Volatile Organic Compounds (VOC).

Potential contaminants associated with the air-born dust/particulates include, but are not limited to: asbestos, polycyclic aromatic hydrocarbons and inorganic compounds including toxic metals that are also accounted for by potential on-site contaminants of concern.

Potential sources of hazardous ground gas that could impact proposed temporary and permanent works include Made Ground deposits on site of unknown depth and composition, infilled dock to the west of the site and the underlying Tidal Flat Deposits to the east, which may comprise peat deposits.

4.3 Other Considerations

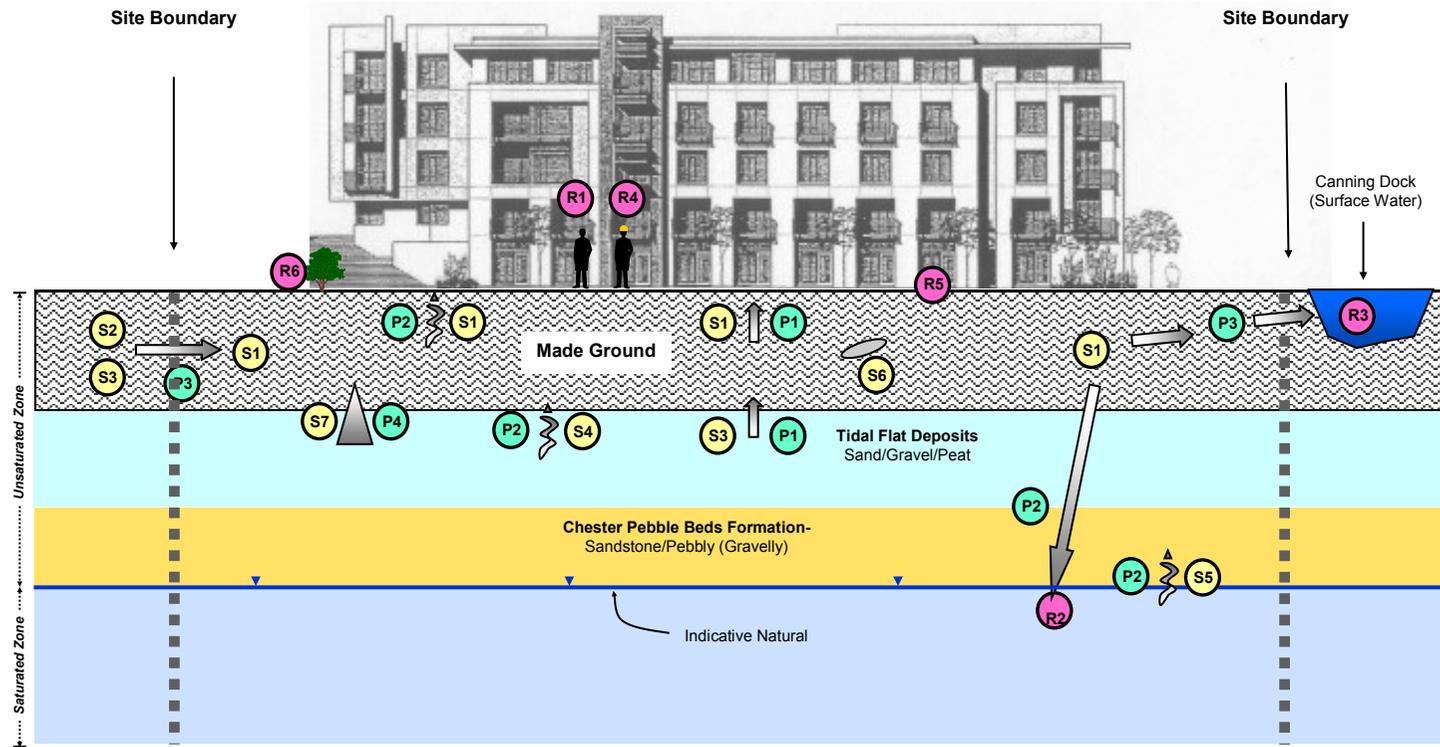

The requirement for additional surveys, e.g. arboricultural and ecological surveys, should be confirmed through advice from a suitably qualified and experienced professional.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

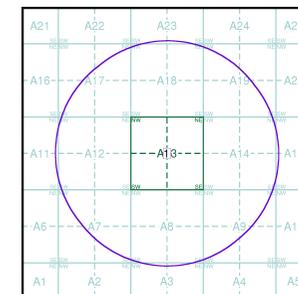

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Geology 1:50,000 Maps Coverage

Map ID:	1
Map Sheet No:	096
Map Name:	Liverpool
Map Date:	2006
Bedrock Geology:	Available
Superficial Geology:	Available
Artificial Geology:	Available
Faults:	Not Supplied
Landslip:	Available
Rock Segments:	Not Supplied

Geology 1:50,000 Maps - Slice A

Artificial Ground and Landslip

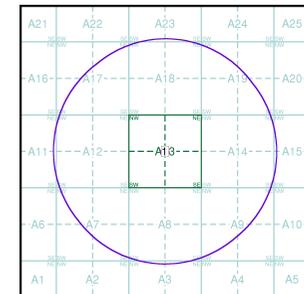

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

Artificial ground includes:

- Made ground - man-made deposits such as embankments and spoil heaps on the natural ground surface.
- Worked ground - areas where the ground has been cut away such as quarries and road cuttings.
- Infilled ground - areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground - areas where the surface has been reshaped.
- Disturbed ground - areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground separately.

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

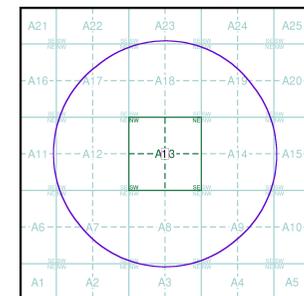

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

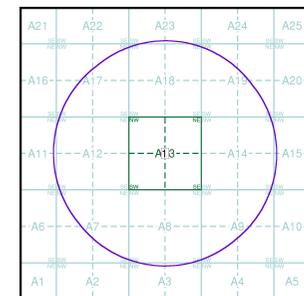

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.
